

PRD Generator

Powered by Claude — generates a structured PRD and scores it with an LLM-as-judge eval.

Describe your product idea

A tool that helps remote engineering teams run async standups via Slack

Generate PRD

StandupSync

Problem Statement

Remote engineering teams spread across multiple time zones struggle to coordinate daily standups without disrupting deep work or forcing inconvenient meeting times. Traditional synchronous standups create scheduling conflicts, reduce focus time, and often exclude team members in distant time zones. Async alternatives today are either manual (posting free-form Slack messages) or rely on expensive, feature-heavy tools that lack tight Slack integration. With remote-first engineering now standard, teams need a lightweight, structured async standup solution that fits naturally into their existing Slack workflows.

Target Users

- Remote software engineers participating in daily standups
- Engineering managers and tech leads who need visibility into team progress and blockers
- DevOps and platform engineers working across distributed time zones
- Scrum masters and Agile coaches facilitating async ceremonies for distributed teams

User Stories

1. As a remote software engineer, I want to receive a scheduled Slack DM prompt asking me my standup questions so that I can answer at my own convenience without joining a live call
2. As an engineering manager, I want a daily digest posted to a designated Slack channel summarizing all team responses so that I can quickly identify blockers without reading individual messages
3. As a tech lead, I want to configure custom standup questions per team so that the prompts reflect our specific workflow and sprint goals
4. As a remote engineer, I want to be reminded once if I have not submitted my standup by a configurable deadline so that I do not forget without feeling micromanaged
5. As an engineering manager, I want to flag a teammate's blocker with a reaction or button in the digest so that it triggers a Slack thread and notifies the relevant team members
6. As a scrum master, I want to view a weekly participation report so that I can track standup completion rates and identify engagement issues over time
7. As a remote engineer, I want to skip a standup day with a single command and provide an optional reason so that my absence is acknowledged without manual follow-up

Acceptance Criteria

- The Slack bot sends configurable DM prompts to each team member at a scheduled time (timezone-aware, per user) with at least the default questions: What did you do yesterday? What will you do today? Any blockers?
- Users can respond directly in the Slack DM thread; responses are captured and stored within 2 seconds of submission
- A structured digest message is automatically posted to a designated Slack channel within 5 minutes of the configured deadline, listing each team member's responses in a consistent format
- If a team member has not responded by 80% of the window before the deadline, the bot sends exactly one reminder DM
- Admins can create, edit, and delete teams, assign Slack channel destinations, set standup schedule times, configure per-timezone delivery, and customize up to 5 standup questions via a web-based settings dashboard
- Clicking a 'Flag Blocker' button on a digest entry opens a Slack thread and sends a notification to the flagged engineer and the team lead
- Engineers can type /standup skip [optional reason] in Slack to skip that day's standup; the digest shows their name with 'Skipped' and the reason if provided
- Weekly participation reports are accessible via the dashboard and show per-user submission rates, skip rates, and average response time for the trailing 4 weeks
- The bot handles Slack workspace OAuth installation with appropriate scopes and supports multi-workspace deployments
- All standup responses are stored with encryption at rest and are retrievable for up to 90 days

Success Metrics

Metric	Baseline	Target
Daily standup completion rate (percentage of team members submitting a response on scheduled days)	Estimated 55% for teams using ad-hoc Slack messages	80% or higher within 60 days of onboarding
Time-to-first-response after prompt delivery (median minutes for engineers to submit standup)	No baseline; establish in first 30 days	Median response time under 30 minutes during the user's working hours
Engineering manager satisfaction score (CSAT survey after 30 days of use, 1-5 scale)	No baseline; establish at launch	Average score of 4.2 or above out of 5
Weekly active teams (teams with at least 3 standups posted in the past 7 days)	0 at launch	50 active teams within 90 days of public availability
30-day team retention rate (teams still running standups 30 days after first standup)	No baseline; establish in first cohort	70% or higher

Risks & Open Questions

- Slack API rate limits may throttle DM delivery for large teams; need to test batch delivery at scale and implement queuing
- User privacy concerns: engineers may resist having standup responses stored and searchable — need clear data retention policy and opt-out options
- How should the digest handle teams larger than 20 people where a single channel message could be very long? Threaded responses or pagination may be needed
- Timezone detection relies on Slack profile data which users often leave blank; what is the fallback if timezone is not set?
- Will the product support non-engineering teams (e.g., design, product) or remain engineering-focused? This affects question templates and positioning
- Slack workspace admins must approve OAuth installation; enterprise customers with strict security reviews may have long approval cycles
- If a team uses both StandupSync and another standup bot simultaneously, duplicate prompts could frustrate users — need onboarding guidance
- How do we handle public holidays or PTO without manual configuration by every team member?

Out of Scope

- Video or audio standup recording or transcription
- Integration with project management tools (Jira, Linear, Asana) in the initial release
- Native mobile or desktop application — Slack is the only interface at launch
- AI-generated standup summaries or sentiment analysis
- Support for standup formats outside of daily text-based Q&A (e.g., weekly retrospectives, sprint planning)
- Single sign-on (SSO) or SAML authentication for the settings dashboard in v1
- Real-time synchronous standup facilitation or video meeting scheduling
- Custom branding or white-labeling for enterprise resellers

Eval Results

Overall Score: 8.7 / 10

Specificity	Measurability	Testability	User Centricity	Completeness
9 / 10	8 / 10	9 / 10	8 / 10	9 / 10
Requirements are highly concrete with precise thresholds (e.g., 2-second capture, 5-minute digest delay, 80% window reminder, up to 5 questions) leaving little room for ambiguity.	Five metrics with explicit targets and baselines are defined, though two metrics lack baselines and rely on first-cohort establishment, slightly weakening pre-launch predictability.	Acceptance criteria are largely objective and verifiable with specific numeric bounds, named commands, and observable system behaviors, making QA straightforward.	Seven well-formed user stories cover four distinct personas with clear motivations, though edge-case personas like part-time contractors or engineers with irregular schedules are not addressed.	All standard PRD sections are present and detailed, including out-of-scope items, risks, open questions, and a security note, with only a competitive analysis and monetization/pricing section notably absent.

Top 3 Improvements

1. Add a competitive analysis section comparing StandupSync against existing tools (Geekbot, Standuply, Slack Workflow Builder) to sharpen differentiation and positioning.
2. Define a fallback and escalation policy for missing timezone data (e.g., default to workspace admin timezone with an onboarding prompt) to resolve the open question that currently has no proposed answer.
3. Include a monetization and pricing model section (freemium tier limits, paid plan thresholds, enterprise pricing triggers) since the product targets both SMB and enterprise segments with distinct sales motions.
